What is the energy storage Grand Challenge roadmap? In December, the U.S. Department of Energy (DOE) released the Energy Storage Grand Challenge Roadmap, the Department's first comprehensive energy storage strategy. DOE previously released a draft version of this Roadmap in July along with a Request for Information (RFI). How much will energy storage cost in 2020? With six use cases that identify energy storage applications, benefits, and functional requirements for 2020 and beyond, the ESGC has identified cost and performance targets, which include: \$0.05/kWh levelized cost of storage for long-duration stationary applications, a 90% reduction from baseline costs by 2020. Can long term energy storage be used in residential buildings? In brief, this paper presents a completely new technological concept which couples the power and heat sector by cost efficient long term energy storage and evaluates the potential for the application in residential buildings. The energy demand of residential buildings represents a huge share of the global end energy use. What is the energy storage Grand Challenge (ESGC)? The Department reviewed the comments from stakeholders and made updates and modifications to the Roadmap based on this feedback. Announced in January by DOE, the Energy Storage Grand Challenge (ESGC) seeks to create and sustain American leadership in energy storage. What is decentralized long term energy storage in buildings? Therefore, we developed a technological concept for decentralized long term energy storage in buildings that connects the locally available electricity production from the local thermal energy demand based on the abundant reactants CaO and water. Figure 2 shows the conceptual process design of the storage system. Can a cost and energy efficient long term storage system couple power and heat? This paper presents the development of a novel concept which couples the power and heat sector by a cost and energy efficient long term storage system. The concept is based on the thermochemical reaction of calcium hydroxide to calcium oxide and water vapor, which yet has never been considered as seasonal storage for buildings. The improved electricity storage concept applies an efficient low-cost high temperature thermal energy storage technology for both, the hot- and the cold thermal storage. This concept not only allows for a bigger temperature spread and simplified operation, but also reduces CAPEX significantly.
