This paper provides a comprehensive review of lithium-ion batteries for grid-scale energy storage, exploring their capabilities and attributes. What is a battery energy storage system? A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed. Are battery energy-storage technologies necessary for grid-scale energy storage? The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However, this technology alone does not meet all the requirements for grid-scale energy storage. What types of batteries can be used for energy storage? Besides lithium-ion batteries, other types of batteries, such as redox flow batteries, sodium-ion batteries, zinc batteries, and solid-state batteries could also be used in different energy storage applications. What types of battery technologies are being developed for grid-scale energy storage? In this Review, we describe BESTs being developed for grid-scale energy storage, including high-energy, aqueous, redox flow, high-temperature and gas batteries. Battery technologies support various power system services, including providing grid support services and preventing curtailment. A promising technology for performing that task is the flow battery, an electrochemical device that can store hundreds of megawatt-hours of energy--enough to keep thousands of homes running for many hours on a single charge. Battery storage is a technology that enables power system operators and utilities to store energy for later use. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to Supercapacitors, also known as ultracapacitors, are energy storage devices that bridge the gap between traditional capacitors and rechargeable batteries. They store energy through a combination of electrostatic and electrochemical mechanisms that allow for rapid charge and discharge cycles. The lithium-ion batteries used for energy storage are very similar to those of electric vehicles and the mass production to meet the demand of electric mobility "is making their costs reduce a lot and their application viable to store large volumes of energy, which is known as stationary storage," Associate Professor Fikile Brushett (left) and Kara Rodby PhD '22 have demonstrated a modeling framework that can help guide the development of flow batteries for large-scale, long-duration electricity storage on a future grid dominated by intermittent solar and wind power generators.
