What is the future of energy storage in Finland? Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. Mainly battery storage and thermal energy storages have been deployed so far. The share of renewable energy sources is growing rapidly in Finland. What factors influence the development of energy storage activities in Finland? Several parameters are influencing the development of energy storage activities in Finland, including increased VRES production capacities, prospects to import/export electricity, investment aid, legislation, the electricity and reserve markets and geographic circumstances. Is energy storage the future of wind power generation in Finland? Wind power generation is estimated to grow substantially in the future in Finland. Energy storage may provide the flexibility needed in the energy transition. Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. Which energy storage technologies are being commissioned in Finland? Currently, utility-scale energy storage technologies that have been commissioned in Finland are limited to BESS (lithium-ion batteries) and TES, mainly TTES and Cavern Thermal Energy Storages (CTES) connected to DH systems. Is energy storage legal in Finland? Like the energy storage market, legislation related to energy storage is still developing in Finland. The two are intertwined as who is allowed to own and operate energy storages will define the business models of the storages. A major barrier to the implementation of ESS was removed when the issue of double taxation was solved. What is the storage capacity of water tank thermal energy storage in Finland? Water TTESs found in Finland are listed in Table 7. The total storage capacity of the TTES in operation is about 11.4 GWh, and the storage capacity of the TTES under planning is about 4.2 GWh. Table 7. Water tank thermal energy storages in Finland. The Pori TTES will be used for both heat and cold storage. Reduce your energy costs as much as 40% - get the best efficiency at all operating conditions and lower your annual energy consumption. The large-scale is capable of producing more than 100MW, while the small-scale only produce less than 10 kW [60]. The small-scale produces energy between 10 kW - 100MW [61]. Large-scale CAES systems are designed for pumped hydro energy storage (PHES) [7]. Enter Finland's air-cooled energy storage solution - a system that's about as straightforward as a Scandinavian furniture manual, but way more revolutionary. Unlike forced liquid circulation methods, this approach uses: Wait, no - let me correct that. The true innovation lies in combining three mechanisms to cope with this large share of generation from variable renewable energy sources. Energy storage is one solution that can provide this flexibility and is therefore expected to grow. This study reviews the status and prospects for energy storage activities in Finland. The
