Why do data centers need liquid cooling? Liquid cooling also allows for more space-efficient designs in data centers. Unlike air cooling, which requires plenty of room for air circulation, liquid-cooled equipment can be packed more tightly. This helps businesses maximize their data center capacity without needing to expand their physical space. Why do you need a liquid cooling system? Performance demands are rising. Meeting them is going to increase operational costs--cooling in particular. Luckily, as innovation heats up your cloud and data centers, Supermicro's complete liquid cooling solutions help you stay cool and confident. Is precision liquid cooling the future of data centers? Sustainability is key to the future of data centers, and precision liquid cooling provides a greener alternative to air-based systems. Water, a more efficient coolant than air, enables waste heat to be recycled for heating buildings or returned to the power grid, reducing the environmental footprint of data centers. What is a data center cooling system? Advanced data center cooling systems enable In-rack coolant distribution units (CDUs) or liquid cooling loops to tie into existing facility water cooling systems, integrating cooling down to the blade or chip level with liquid cold plates featuring custom skylines for maximum interface between heat sources and the liquid system. What is liquid cooling & how does it work? Compared to traditional cooling methods, liquid cooling uses far less energy. By cooling key components directly, it lowers the overall heat in the facility, which means the air-conditioning systems don't have to work as hard. Liquid cooling also allows for more space-efficient designs in data centers. What are the benefits of liquid cooling? Along with being energy-efficient, liquid cooling reduces long-term operating costs. Liquid-cooled systems typically need less maintenance and have fewer breakdowns from overheating, leading to longer-lasting hardware and less downtime.
