W is the energy stored in the inductor, measured in joules (J) 2. L is the inductance of the inductor, measured in henrys (H) 3. I is the current passing through the inductor, measured in amperes (A) This equation tells us that the energy stored in the inductor is directly proportional to the square of the current passing through it and the inductance of the coil. As the current increases, the energy stored in This energy is actually stored in the magnetic field generated by the current flowing through the inductor. In a pure inductor, the energy is stored without loss, and is returned to the rest of the circuit when the current through the inductor is ramped down, and its associated magnetic field collapses.
