What is energy storage performance testing? Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems. Are there safety standards for batteries for stationary battery energy storage systems? This overview of currently available safety standards for batteries for stationary battery energy storage systems shows that a number of standards exist that include some of the safety tests required by the Regulation concerning batteries and waste batteries, forming a good basis for the development of the regulatory tests. What is a battery energy storage system? 1. Introduction Battery energy storage systems (BESSs) are being installed in power systems around the world to improve efficiency, reliability, and resilience. This is driven in part by: engineers finding better ways to utilize battery storage, the falling cost of batteries, and improvements in BESS performance. How do integrated system tests measure energy storage performance? Integrated system tests are applied uniformly across energy storage technologies to yield performance data. Duty-cycle testing can produce data on application-specific performance of energy storage systems. This chapter reviewed a range of duty-cycle tests intended to measure performance of energy storage supplying grid services. What are the different types of battery energy storage systems? There are four main energy storage systems that are addressed in this research: lead-acid, lithium-ion, sodium-sulfur, and flow batteries. Review of global market reports indicates that lead-acid and lithium-ion were the primary battery energy storage systems used, each has its own advantages and disadvantages. What is a stored energy test? The goal of the stored energy test is to calculate how much energy can be supplied discharging, how much energy must be supplied recharging, and how efficient this cycle is. The test procedure applied to the DUT is as follows: Specify charge power P_{cha} and discharge power P_{dis} Preconditioning (only performed before testing starts): Global Overview of Energy Storage Performance Test One of the Energy Storage Partnership partners in this working group, the National Renewable Energy Laboratory, has moved forward to collect and analyze information about the existing DOE ESHB Chapter 16 Energy Storage Performance Testing His research interests include modeling and simulation, performance testing, safety, and standardization of battery energy storage systems.
