Does industry need standards for energy storage? As cited in the DOE OE ES Program Plan, "Industry requires specifications of standards for characterizing the performance of energy storage under grid conditions and for modeling behavior. Discussions with industry professionals indicate a significant need for standards" [1, p. 30]. What is the UL standard for energy storage systems? For ESS, the standard is UL 9540, Standard for Energy Storage Systems and Equipment. UL covers the complete ESS, including battery system, power conversion system (PCS), and energy storage management system (ESMS). Each of these components must be qualified to its own standard: Do energy storage systems need to be certified? U.S. fire and electrical codes require that energy storage systems be listed, meaning the product must be tested by a Nationally Recognized Testing Laboratory (a private-sector organization recognized by the Occupational Safety and Health Administration) and certified to meet consensus-based test standards. What is a framework for evaluating energy storage technologies in stationary applications? A framework for this assessment is provided by IEEE Std 1547.4, IEEE Recommended Practice for the Characterization and Evaluation of Energy Storage Technologies in Stationary Applications. Additional guidance is provided for certain classes of battery systems in a series of subsidiary documents. Are energy storage systems viable and economically reasonable? However, such storage systems become viable and economically reasonable only if the grids have to carry and distribute large amounts of volatile electricity from REs. The first demonstration and pilot plants are currently under construction (e.g. in Europe). What is energy storage medium? Batteries and the BMS are replaced by the "Energy Storage Medium", to represent any storage technologies including the necessary energy conversion subsystem. The control hierarchy can be further generalized to include other storage systems or devices connected to the grid, illustrated in Figure 3-19.
