Which energy storage technologies are being commissioned in Finland? Currently, utility-scale energy storage technologies that have been commissioned in Finland are limited to BESS (lithium-ion batteries) and TES, mainly TTES and Cavern Thermal Energy Storages (CTES) connected to DH systems. Is the energy system still working in Finland? However, the energy system is still producing electricity to the national grid and DH to the Lempäälä area, while the BESSs participate in Fingrid's market for balancing the grid. Like the energy storage market, legislation related to energy storage is still developing in Finland. What is the future of energy storage in Finland? Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. Mainly battery storage and thermal energy storages have been deployed so far. The share of renewable energy sources is growing rapidly in Finland. Is energy storage legal in Finland? Like the energy storage market, legislation related to energy storage is still developing in Finland. The two are intertwined as who is allowed to own and operate energy storages will define the business models of the storages. A major barrier to the implementation of ESS was removed when the issue of double taxation was solved. How much electricity does Finland use? In 2022, the total electricity consumption in Finland was 81.7 TWh. Finland's energy consumption per capita is relatively high due to its cold climate, energy-intensive industries and being sparsely populated, leading to long traveling and transport distances. How much does wind power cost in Finland? Since 2010, wind power installations in Finland have been entirely commercially built and are mainly based on mutual power purchase agreements. The price levels for these agreements can be as low as 30 EUR/MWh, and onshore wind is currently the cheapest source of electricity in Finland. This paper has provided a comprehensive review of the current status and developments of energy storage in Finland, and this information could prove useful in future modeling studies of the Finnish energy system that incorporate energy storages. This paper has provided a comprehensive review of the current status and developments of energy storage in Finland, and this information could prove useful in future modeling studies of the Finnish energy system that incorporate energy storages. Over the past three years, Finland's energy storage market has grown faster than a Helsinki startup - jumping from EUR180 million in 2019 to an estimated EUR320 million in 2022. But here's the kicker: module prices dropped 12% during the same period. How's that possible? Let's unpack this paradox. In order to harmonise its pricing practices, Fingrid has decided to introduce a new component to the grid service fees, a capacity fee for grid energy storages, on August 1st, 2022. The introduction of this fee is subject to the confirmation by the Energy Authority of the proposed amendments to the Electricity Act. You know, Finland's electricity prices have been rollercoasting since 2021. Last winter saw prices spike to EUR245/MWh - that's 400% higher than the average. But wait, no actually, regional differences matter. Lapland's off-grid communities paid even more during polar nights when solar In 2022, the average ancillary market reservation price went from 15EUR/MW/h for mFRR upward reservation to 47EUR/MW/h for FCR-N reservation. At the same time, the day-ahead market showed significant spreads, averaging 133EUR/MWh in November. According to the Clean Horizon
