Is the energy system still working in Finland? However, the energy system is still producing electricity to the national grid and DH to the Lempäälä area, while the BESSs participate in Fingrid's market for balancing the grid. Like the energy storage market, legislation related to energy storage is still developing in Finland. What is the future of energy storage in Finland? Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. Mainly battery storage and thermal energy storages have been deployed so far. The share of renewable energy sources is growing rapidly in Finland. Is energy storage legal in Finland? Like the energy storage market, legislation related to energy storage is still developing in Finland. The two are intertwined as who is allowed to own and operate energy storages will define the business models of the storages. A major barrier to the implementation of ESS was removed when the issue of double taxation was solved. Is energy storage the future of wind power generation in Finland? Wind power generation is estimated to grow substantially in the future in Finland. Energy storage may provide the flexibility needed in the energy transition. Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. Which energy storage technologies are being commissioned in Finland? Currently, utility-scale energy storage technologies that have been commissioned in Finland are limited to BESS (lithium-ion batteries) and TES, mainly TTES and Cavern Thermal Energy Storages (CTES) connected to DH systems. What factors influence the development of energy storage activities in Finland? Several parameters are influencing the development of energy storage activities in Finland, including increased VRES production capacities, prospects to import/export electricity, investment aid, legislation, the electricity and reserve markets and geographic circumstances. This paper has provided a comprehensive review of the current status and developments of energy storage in Finland, and this information could prove useful in future modeling studies of the Finnish energy system that incorporate energy storages. This paper has provided a comprehensive review of the current status and developments of energy storage in Finland, and this information could prove useful in future modeling studies of the Finnish energy system that incorporate energy storages. This document contains the Grid Code Specifications for Grid Energy Storage Systems (hereinafter referred to as "Specifications") required by Fingrid Oyj (hereinafter referred to as "Fingrid"), by virtue of the system responsibility imposed on Fingrid, of converter-connected grid energy storage systems, with about 0.2 GWh currently in operation and a further 0.4 GWh planned. A similar growth in thermal energy storage systems, with about 39 GWh in operation and a further 176 GWh under planning, has been reported. This rapid development has been facilitated by the provision of Liquid-cooled energy storage battery Finland's three guarantees regulations. Liquid-cooled energy storage battery Finland's three guarantees regulations. The increasing penetration of renewable energy has led electrical energy storage systems to have a key role in balancing and increasing the Thus, in order to avoid over- and underproduction via spikes of generation, there needs to be technology implemented to store this excess intermittent
