How does a Flywheel energy storage system work? Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. This is a common method for energy storage. What is a flywheel storage system? A flywheel storage system is also almost identical in many respects to a power generator - it's often built around a magnetic coil so the motor and the output generator are the same piece of hardware, with simple switching reversing the circuit to switch between spin-up and discharge. Why would you want to fit it IN a home? What is the cost of Flywheel storage? The cost of a 25-kWh Flywheel storage system ranges from \$4,015 to \$7,400. The cost of battery storage is from \$3,972 to \$8,700. The efficiency of a Flywheel system is 73 percent compared with 65 percent for a battery system. Flywheel Energy Storage for Dummies ?
