Is glass a potential material for energy storage and photonic applications? Chakrabarti, A., Menon, S., Tarafder, A., Molla, A.R. (). Glass-ceramics: A Potential Material for Energy Storage and Photonic Applications. Why do we need glass-ceramic materials for energy storage systems? The demand for next-generation energy storage systems in modern miniaturized electronic components will require glass-ceramic materials that can provide high power, higher energy density, ultrafast discharge speeds, high-temperature stability, stable frequency, and environmental friendliness. What affects the energy storage properties of ferroelectric glass-ceramic? The energy storage properties of a ferroelectric glass-ceramic are significantly affected by the size, grain morphology, and the number of defects of the ferroelectric ceramic phase present in the glass matrix. A crystal phase with large grains can lead to cracks, pores, and other defects in the microstructure which will degrade the BDS. What is the energy storage density of glass-ceramics with 1 mol% Gd_2O_3 ? Glass-ceramics with 1 mol% Gd_2O_3 exhibited a high energy storage density of 12.14 J/cm^3 , a BDS of kV/cm with a discharge efficiency of 80%, and a discharge time of 25 ns. The BNN glass-ceramics were synthesized by combining conventional and microwave heating. What is the energy storage density of bst80/20 glass-ceramic samples? The energy storage density followed a similar trend, ranging from 0.9 J/cm^3 for BST 50/50 to 0.28 J/cm^3 for BST80/20 glass-ceramic samples. Such low energy density values were attributed to the dendritic microstructure which created a high field concentration at the dendrite tips causing early breakdown. Which material is suitable for capacitive energy storage applications? Therefore, for suitability for capacitive energy storage applications, a dielectric material having a high dielectric constant with low dielectric losses at various frequencies, low hysteresis energy loss, high thermal stability, and high BDS is desirable [39, 40].
