In addition to the design basis considerations for instrumentation that is discussed in section 1 of this document, the following additional considerations should be considered regarding the design, testing, operation and maintenance of level instrumentation in a pumped storage plant. Field instrumentation is essential for operational safety. How do you ensure the safety of hydroelectric power plants? Adhering to regulations and standards is critical for ensuring the safety of hydroelectric power plants. Various national and international bodies outline safety requirements. Some key regulations and standards include: 1. Occupational Safety and Health Administration (OSHA) How pumped storage projects affect dam and Public Safety? Pumping is the principal feature that sets pumped storage projects apart from conventional hydro projects and overtopping of a project reservoir is the principal failure mode that could impact dam and public safety. Therefore, control and management of water levels is critical to assuring dam and public safety. What is hydroelectric power plant safety? At its core, hydroelectric power plant safety encompasses a wide range of practices, regulations, and technologies designed to mitigate risks inherent to hydroelectric facilities. These plants harness the kinetic energy of flowing water to generate electricity, but they also pose unique challenges. Can a pumped storage plant operate year-round? Indeed, if the turbine is in a base-loaded plant and the power output of the plant is adjusted to meet the demands of the available head, the plant would be able to operate year-round at a constant efficiency of 91%. Pumped storage plants would realize an additional payoff in efficiency if the variable-speed operation were adopted. What are the hazards associated with hydroelectric power plant safety? Below are some of the primary hazards associated with hydroelectric power plant safety: 1. Mechanical Failures Mechanical failures can occur in turbines, generators, and other equipment. These failures may result from manufacturing defects, wear and tear, or improper maintenance.
