Are lithium-ion battery energy storage systems fire safe? With the advantages of high energy density, short response time and low economic cost, utility-scale lithium-ion battery energy storage systems are built and installed around the world. However, due to the thermal runaway characteristics of lithium-ion batteries, much more attention is attracted to the fire safety of battery energy storage systems. Are battery energy storage systems a fire hazard? As the demand for renewable energy sources escalates, Battery Energy Storage Systems (BESS) have become pivotal in stabilizing the electrical grid and ensuring a continuous power supply. However, the high-density energy stored in these systems poses significant fire risks, necessitating cutting-edge fire suppression solutions. What is battery energy storage fire prevention & mitigation? In , EPRI began the Battery Energy Storage Fire Prevention and Mitigation - Phase I research project, convened a group of experts, and conducted a series of energy storage site surveys and industry workshops to identify critical research and development (R& D) needs regarding battery safety. What happens if an energy storage station fires? Since a large amount of energy is stored in the energy storage station in the form of chemical energy, once this energy is released in the form of heat and fire, it will cause serious damage. For example, in , three LFP battery energy storage station fire accidents occurred in Germany within three months .
