Why is energy storage important? This makes energy storage increasingly important, as renewable energy cannot provide steady and interrupted flows of electricity - the sun does not always shine, and the wind does not always blow. As a result, we need to find ways of storing excess power when wind turbines are spinning fast, and solar panels are getting plenty of rays. Can hydropower be used to store energy? Pumped storage hydropower makes up 94% of the world's energy storage, the International Hydropower Association says, adding that studies suggest a significant potential to scale this up even further. What about storing energy in compressed air? How does compressed air energy storage work? It works by using surplus power to run a rotary compressor that condenses air. This highly pressurized air is then packed into an underground cavern or container and can later be released, heated and expanded in a turbine to generate power. Compressed air energy storage involves moving highly pressurized air into underground caverns. What is the difference between pumped hydro and compressed air energy storage? While pumped hydro moves water upwards, compressed air energy storage (CAES) involves moving energy underground. It works by using surplus power to run a rotary compressor that condenses air. Can energy be stored in liquid air? Instead of storing energy in compressed air, it can also be stored in liquid air. This is done using excess renewable energy to power a liquefier, which cools and compresses air into a liquid form at -196°C .
