What time does the energy storage power station operate? During the three time periods of -, -, and -, the loads are supplied by the renewable energy, and the excess renewable energy is stored in the FESPS or/and transferred to the other buses. Table 1. Energy storage power station. Where should the energy storage power station be located? Among the rest, compared with the wind turbine side and the point of grid-connected wind power cluster, it is more appropriate to configure the energy storage power station in the gathering place of the wind farm group. How is energy storage power station distributed? The energy storage power station is dynamically distributed according to the chargeable/dischargeable capacity, the critical over-charging ES 1# reversely discharges 0.1 MW, and the ES 2# multi-absorption power is 1.1 MW. The system has rich power of 0.7MW in 1.5-2.5 s. What are battery storage power stations? Battery storage power stations are usually composed of batteries, power conversion systems (inverters), control systems and monitoring equipment. There are a variety of battery types used, including lithium-ion, lead-acid, flow cell batteries, and others, depending on factors such as energy density, cycle life, and cost. When does the energy storage system choose not to discharge? When the grid price is in the valley period, such as -, the energy storage system chooses not to discharge regardless of the power shortage. Thereafter, the energy storage system initiates the discharging mechanism when the grid price is in the peak period starting period of . What happens when energy storage absorption power is in critical state? When the energy storage absorption power of the system is in critical state, the over-charged energy storage power station can absorb the multi-charged energy storage of other energy storage power stations and still maintain the discharge state, so as to avoid the occurrence of over-charged event and improve the stability of the black-start system. For a shortage of renewable energy power (corresponding to the period -), the time and power corresponding to the energy storage discharging mechanism can be determined according to the real-time power grid price, and the peak valley difference can be arbitrated. For a shortage of renewable energy power (corresponding to the period -), the time and power corresponding to the energy storage discharging mechanism can be determined according to the real-time power grid price, and the peak valley difference can be arbitrated.
