Can service stacking improve energy storage system integration? Service stacking is a promising method to improve energy storage system integration. There are several interesting cases where service stacking is crucial. Frequency supportive services are the most common to add when expanding portfolios. There is no standard method to solve optimization of service portfolios. Why do we need energy storage systems? In order to use as much as possible of the produced energy, energy storage systems (ESS) are suitable enablers to allow integration of more RES in the power system. As cities grow and industry expands new users will request to be connected to the grid. Also, users that are already connected might request more capacity to meet future demand. What are energy storage solutions for grid applications? Energy storage solutions for grid applications are becoming more common among grid owners, system operators and end-users. Storage systems are enablers of several possibilities and may provide efficient solutions to e.g., energy balancing, ancillary services as well as deferral of infrastructure investments. Does service stacking increase the utilization of storage units? It can be concluded that service stacking is a promising method to implement for storage operators to increase the degree of utilization of storage units. It may also be concluded that the increased need for ancillary services increases the opportunity for storage units to participate in markets for energy and ancillary services. Are energy storage systems a good choice for grid applications? Previous research shows that ESSs are promising for grid applications and may provide a bundle of services, , , . Most common is that energy storage is implemented for one service and one application at the time. Although, high investment costs have created a market barrier and as a result, upcoming technologies remain at research level. What is the optimal ESS for service stacking? From the reviewed literature the "optimality" approach varies frequently between the two cases with a majority of objective functions maximizing profit as main target. From the review it is found that the typical ESS used for service stacking is a 1C storage with approx. 1 MW/1 MWh rated power and energy capacities.
