What is a solar metering energy system? A solar metering energy system is a system that uses the electrical grid to store the excess electricity produced by domestic or commercial solar panels. The electrical meter installed inside a house or any other commercial building records the power consumption. Thus, people only need to pay for the net energy consumed by them. How to use solar metering? To use this system, people need to have proper solar metering energy set up consisting of a solar panel, solar inverter, bidirectional meter, and an electricity connection. Since there is an absence of a battery for power storage, an electricity connection is essential to transfer the unused energy to the grid. How much does net metering cost on a rooftop solar system? Net metering helps rooftop solar owners get a return on their investment, and the excess energy sent by the system helps utilities balance the grid and meet demand. Currently, average net-metering rates range from \$0.23/kWh to \$0.35/kWh, and the new proposed decision cuts those rates to an average of \$0.05/kWh to \$0.08/kWh. How much does it cost to install a solar meter? If it isn't part of your installation quote, this usually costs about \$300. It'll cost more if you have a three phase supply. You are not normally allowed to switch your solar power system on until your new meter is installed. To help pass the time, you can do some simple checks of the install. What is a solar meter? A solar meter is basically a device that measures solar power or sunshine in W/m² and may be used to check the effectiveness of windows or to install solar power equipment. To monitor and assess PV plant performance, solar meters collect PV yield output and local energy usage. What is solar net metering? Net metering allows you to store every unit of energy you produce with solar to be used at a later date from the grid. It can help you save thousands of dollars over the lifetime of your solar panel system.
