This calculator provides the calculation of energy stored in a supercapacitor for electrical engineering applications. Calculation Example: Supercapacitors are energy storage devices that use electrostatic charge to store energy. They are characterized by their high power density and long cycle life. The simple energy calculation will fall short unless you take into account the details that impact available energy storage over the supercapacitor lifetime. In a power backup or holdup system, the energy storage medium can make up a significant percentage of the total bill of materials (BOM) cost. Calculating the energy stored in a supercapacitor isn't as complex as it might sound. All you need are two values: the energy density and the mass of the supercapacitor. The formula to calculate the supercapacitor energy is: Energy Stored is the energy contained within the supercapacitor, measured in Joules. This calculator determines timekeeping operation using a super capacitor (supercap) based upon starting and ending capacitor voltages, discharge current, and capacitor size. $t = [C (V_{capmax} - V_{capmin})/I_{max}]$ This formula is valid for constant current only. $t = -log_{10} \left(\frac{V_{capmin}}{V_{capmax}} \right) \times \frac{C}{I_{max}}$ Calculates stored energy, usable energy and power dissipation in every possible wiring (parallel, serial) for a given number of capacitors range. This prevents from endless manual calculations. If not compatible values are detected, this software suggests calculated corrections for a feasible design.
