How much does compressed air energy storage cost? Our base case for Compressed Air Energy Storage costs require a 26c/kWh storage spread to generate a 10% IRR at a \$1,350/kW CAES facility, with 63% round-trip efficiency, charging and discharging 365 days per year. What is compressed air energy storage (CAES)? What opportunities? Compressed Air Energy Storage (CAES) seeks to smooth out power grids, using excess electricity to compress air into storage tanks or underground reservoirs at high pressures (e.g., 40-80 bar). The energy needed to compress air to different temperatures is plotted below. What is the future of energy storage? Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change. What is energy storage & how does it work? Sometimes energy storage is co-located with, or placed next to, a solar energy system, and sometimes the storage system stands alone, but in either configuration, it can help more effectively integrate solar into the energy landscape. What Is Energy Storage? Can solar energy be used as an energy storage system? Existing compressed air energy storage systems often use the released air as part of a natural gas power cycle to produce electricity. Solar power can be used to create new fuels that can be combusted (burned) or consumed to provide energy, effectively storing the solar energy in the chemical bonds. Does storage reduce electricity cost? Storage can reduce the cost of electricity for developing country economies while providing local and global environmental benefits. Lower storage costs increase both electricity cost savings and environmental benefits. In summary, liquid air energy storage offers one of the lowest costs among long-duration energy storage technologies, with an LCOS around \$60/MWh, significantly cheaper than lithium-ion batteries and cheaper than pumped hydro.
