What is cloud energy storage? Cloud energy storage (CES) in the power systems is a novel idea for the consumers to get rid of the expensive distributed energy storages (DESSs) and to move to using a cloud service centre as a virtual capacity. What happens when Ces users charge their cloud storage? When a CES user charges its cloud storage, the energy storage facility charges by absorbing energy from the grid. When CES users discharge their cloud storage for their own use, the energy storage facility releases the energy to the grid to compensate for the corresponding load of the CES users. Do shared energy storage services exist? Although many studies on energy storage sharing point out the virtual nature of shared energy storage services, no study emphasizes the shared application of VESS. At the same time, in previous studies, VESS usually provides services for power grid companies [93, 94]. How does energy storage sharing work? In this energy storage sharing model, the profits of users come from electricity bill savings, while the system operator gains profits from the difference between the energy storage installation cost and the service fees. Is a heterogeneous cloud energy storage system economically feasible? The economic feasibility of a heterogeneous cloud energy storage (HCES) system is investigated in [44]. The HCES uses four types of batteries known as Lead-acid, Lithium-ion, Sodium Sulphur, and Redox flow technologies. What is cloud energy storage (CES)? Based on the combination of sharing economy and electric energy storage technology, Kang et al. proposed the concept of Cloud Energy Storage (CES) in [1]. Finally, considering the combination of cloud energy storage and other advanced energy and information technology such as multi-energy coordination and blockchain, the evolution path and development prospects of cloud energy storage are discussed. Finally, considering the combination of cloud energy storage and other advanced energy and information technology such as multi-energy coordination and blockchain, the evolution path and development prospects of cloud energy storage are discussed. Energy storage technology is recognized as an underpinning technology to have great potential in coping with a high proportion of renewable power integration and decarbonizing power system. However, the costs of energy storage facilities remain high-level and it makes energy storage a luxury in [2]. Cloud energy storage is a kind of Shared energy storage technology based on the established existing power grid. Users can use the shared energy storage resources composed of centralized or The multi-energy cloud energy storage takes the district heating and natural gas systems as generalized [3]. In recent years, cloud energy storage (CES) as a kind of shared ESS instead of distributed individual batteries for energy storage services has been provided to consumers [20].
