Energy Storage Density Energy density - by weight and volume - for some ways to store energy; Liquids and Fluids - Specific Heats Specific heats for some common liquids and fluids - acetone, oil paraffin, water and eight power electronic devices. To address this The heat capacity of water is 4.2 kJ (= 1.17 Wh) per 1 litre of volume and 1 degree of temperature increase. So, for a 300-litre water tank and 70-degree temperature increase (e.g. from 20 to 90 °C), this comes to 24.5 kWh of stored thermal energy at 90 °C. Since the density of water changes with To compare the thermal energy density storage capacities of sand, paraffin wax, salt, and their combinations (sand and wax, sand and salt, salt and wax), we first need to understand the key properties that influence thermal energy storage: 1.
