1. What are the two methods used in industry for storing natural gas? The two main methods used in industry for storing natural gas are "packed" pipelines and underground storage facilities. The packing of pipelines refers to the intended accumulation of natural gas in pipelines by operators. What is energy storage? Energy storage is a process in which energy can be transformed from forms in which it is difficult to store to the forms that are comparatively easier to use or store. The global energy demand is increasing and with time the available natural sources such as fossil fuel are dwindling. How is natural gas stored? Natural gas may be stored in several different ways. In the modern world, natural gas is most commonly held in inventory underground under pressure in three main types of facilities. These underground facilities are (1) depleted reservoirs in oil and/or natural gas fields, (2) aquifers, and (3) salt cavern formations. Natural gas storage is defined as the practice of storing methane, the main component of natural gas, in various methods such as depleted gas fields, aquifers, and salt caverns, to ensure a reliable supply during high demand periods and enhance energy security.
